Enabling scientific discoveries that improve human health

INFORMATION LEAFLET

UK Biobank Repeat Imaging Assessment Visit

We are inviting you to take part in an important new UK Biobank assessment to help research. It involves taking a repeat set of images (scans) of your brain, heart, tissue and bones, so that scientists can study your internal organs in detail. This will help research into a wide range of diseases, including cancer, heart disease, dementia, diabetes, stroke and arthritis.

We have invited you to take part in this repeat imaging assessment because you have already attended an imaging assessment with us. This invitation is not based on any other information that we have collected about you, either at your first assessment or afterwards. We aim to scan at least 60,000 people over the next few years as part of this repeat imaging study. Combined with other information you have provided, the scans will create a health resource of worldwide significance for many years to come.

We keep all of the information you give us confidential and store it securely. None of the information, samples or images that we provide to researchers will include any details that can identify you.

Taking part is entirely voluntary and will not affect your ongoing relationship with UK Biobank. Please take the time to read this leaflet carefully. It explains why we are asking you to help and what it would involve.

If anything is not clear, or if you would like more information, please phone free of charge on **0800 0 276 276** (Monday to Friday 9am to 5pm) or email us at **ukbiobank@ukbiobank.ac.uk**.

You can find more information and view a video of the participant journey through our imaging centres at **www.ukbiobank.ac.uk/imaging-project**

Thank you for your continued support of UK Biobank.

Without the help of our participants, we would not be able to continue to create such an invaluable resource for health research.

What is UK Biobank?

UK Biobank is a large-scale biomedical database and research resource that contains genetic, lifestyle and health information from half a million UK participants, of which you are one.

Volunteers who were aged between 40 and 69 years when recruited between 2006 and 2010 provided detailed information about their lifestyle, as well as having physical measures taken and blood, urine and saliva samples collected and stored for future analysis.

UK Biobank's database, which now also includes genetic data for all participants and the heart, body, brain, neck artery and bone scans from over 70,000 participants, is globally accessible to approved researchers who are undertaking health-related research that is in the public interest.

While taking part in UK Biobank is not intended to help you directly, it should give future generations a much better chance of living their lives free of diseases that disable and kill. UK Biobank's research resource is a major contributor to the advancement of modern medicine and treatment, enabling better understanding of the prevention, diagnosis and treatment of a wide range of serious and life-threatening illnesses – including cancer, heart disease and stroke.

UK Biobank is generously supported by its founding funders the Medical Research Council and Wellcome, as well as the Department of Health and Social Care, the British Heart Foundation and Cancer Research UK. The organisation has over 200 dedicated members of staff, based in multiple locations across the UK.

Why do you want to scan me?

Taking images of organs inside the body (such as the brain and heart) as well as the surrounding tissues and bones allows scientists to study how the structure and function of the body's organs are related to the development of disease. By collecting scans at different time points, scientists will also be able to study changes that occur in the body's organs over time. The combination of these images with other information already collected about you will provide new and important information for health research on a wide range of diseases.

The scans are for research purposes only. They are not designed to diagnose disease or to detect specific clinical abnormalities. It is important for you to understand that the imaging assessment is not a health check. We will not routinely feed back imaging results to you, your GP or anyone else – this is in accordance with the consent you provided when you agreed to take part in UK Biobank. However, if we happen to notice an abnormal appearance on one of your scans that we think might be serious, we will contact you and your GP. Please read to the end of this leaflet to find out more about this feedback.

Why have you invited me?

You have been invited simply because you have previously attended an imaging assessment with UK Biobank. This invitation is not based on any other information that we have collected about you, either at your first imaging assessment or afterwards. We aim to scan at least 60,000 people over the next few years as part of this repeat imaging study.

What scans will you do and why?

We will repeat the scans that you had during your first imaging assessment visit, which were as follows:

Magnetic resonance imaging (MRI) scans. These use painless magnetic fields to take detailed pictures of the inside of the body (such as organs, tissues and bones). We would like to take two scans: one of the brain and the other of the heart and body (mainly covering the abdomen). The scanners are similar to those used in the NHS but are a little wider so that they are more comfortable.

- **Brain MRI scan.** This will provide information about the structure and function of the brain; for example, which parts of the brain are important for carrying out certain tasks and how different parts of the brain are connected.
- **Heart and body MRI scan.** This will provide information on the size of the heart chambers and blood vessels, and changes in the size of the heart as it beats. It will also provide detailed information on the amount and distribution of fat in the body.

Neck artery ultrasound scan. This uses ultrasound (high-frequency sound waves) to produce images of the blood vessels on either side of the neck. These images will help scientists study any narrowing of these major blood vessels.

Dual-Energy X-ray Absorptiometry (DXA) scan. This uses low-energy X-rays (the same amount as about one week's worth of natural background X-rays) to measure bone density throughout the body. Detailed pictures of the spine, hips and knees will help scientists to study diseases like osteoporosis (thinning of the bones) and arthritis.

We will also undertake some **eye measurements**, similar to those that an optician might perform during a routine eye examination and which you may have completed during an earlier assessment visit. These measurements include:

- **Autorefraction.** This measures how light changes as it comes into the eye, giving an estimate of your prescription.
- **Optical coherence tomography (OCT) scan.** This is a non-invasive, non-contact imaging technique used to obtain high-resolution cross-sectional images of your retina.

Am I eligible to take part?

Even though you were eligible to take part in the baseline imaging assessment, we will need to complete a new eligibility check for the repeat imaging study given that your health and lifestyle may have changed since that first assessment undertaken years ago.

As you may recall from your first visit, all of the scans are safe and painless. The scanners are similar to those used routinely in the NHS. However, since MRI scans involve the use of a magnet, you may not be able to take part if you have an electrical implant (for example, a pacemaker) in your body or metal in certain parts of your body, or if you have had an accident where metal may have entered your body.

If you have had recent surgery, you will be able to take part six weeks after your operation. You will not be able to take part if you have medical problems that make it difficult to carry out the scans (for example, severe hearing or breathing problems, tremors or very restricted mobility).

If you would like to take part but think you might not be eligible to do so, we would still like you to telephone us so that we can check this for you. Please telephone us free of charge on 0800 0 276 276.

Do I have to take part in this repeat imaging assessment?

No, it is entirely voluntary. We do understand that you may not have time or be able to help on this occasion. If now is not a good time for you to take part, please feel free to contact us at a later stage when it is more convenient.

What should I do if I am interested in attending?

Please let us know if you would like to take part by phoning us free of charge on:

0800 0 276 276 (Monday to Friday 9am to 5pm)

During this call, you will be able to ask us any questions that you might have. We will also ask you some questions about your medical history to check your suitability for the scans.

If you are eligible to take part, we will arrange an appointment for you. Appointments are generally available from 8am to 3.20pm, Monday to Sunday, and last for four to five hours.

We will send you a letter confirming your appointment and giving directions to the assessment centre. If you have provided us with an email address and mobile phone number, we will also contact you to remind you about your appointment a few days before your visit.

Can I claim travel expenses?

Your repeat imaging assessment will take place at the centre which you attended for your baseline imaging assessment, to make sure that your repeat set of images are directly comparable to your baseline images.

We appreciate that some participants live a considerable distance away. You can claim the cost of travel to the assessment centre by public or private transport, using the claim form that we will provide you with.

Train and other public transport (i.e. bus, tram, Metro or underground)

For train travel, please keep in mind the following:

- Please buy standard tickets (i.e. not first-class).

- Booking in advance usually means that you get the best value tickets. Where possible, please avoid booking open return tickets as these tend to be the most expensive.
- Buying split tickets may reduce the overall price of your fare. See www.splitticketing.com to find out more.

Private transport (car, motorcycle or bicycle)

We will reimburse you for mileage to and from the assessment centre. Current mileage allowances can be found in our participant travel expense claim policy at www.ukbiobank.ac.uk/travel-expenses-policy and we will advise you about this when you telephone us to enrol in the study.

Car parking

There is free parking at the centre. If you park elsewhere, you can claim car parking costs (but not fines). We have a programme to install electric vehicle (EV) charging points at each of our centres in the future and we will advise you about this when you telephone us to enrol in the study.

Tolls and tunnel fees - may be claimed.

If you need someone to help you during the journey, you can also claim travel expenses for a companion. There is some space with free Wi-Fi where your companion can wait in the reception area. However, it can get busy and the chairs are only adequate for sitting for short periods, so we do recommend that your companion plan to do something outside the centre while you are having your assessment. We will advise you about this when you telephone us to enrol in the study.

Please keep your travel receipts and attach them to your claim form which we will give you at the end of your visit.

What happens DURING the repeat imaging assessment visit?

The assessment will take four to five hours and will involve the following:

First steps

- A radiographer will ask you the same questions that you answered when you made the appointment. This is to double-check that you are able to have all of the different types of scans.

- You can ask any questions that you might have, and we will then ask you to complete and sign a consent form. This tells us that you agree to be scanned, and that you understand the nature and purpose of the imaging process and any potential implications.
- We will show you to a private cubicle where we will give you special, loose-fitting clothes to change into. You will not need to remove your underpants (but please do not wear underwear containing Lycra, Spandex or any sort of metal or jewel embellishments). We will ask anyone wearing a bra to remove it as it may contain metal.
- We will ask you to leave any loose metal objects (such as money, credit cards, keys, pens, mobile phones, jewellery, watches, hair pins, metal dentures, hearing aids and spectacles) in one of the secure lockers. We will also ask you to remove any skin patches (for example, nicotine or pain relief patches) during the assessment so you might want to bring a replacement patch with you.
- If you have a monitor fitted (such as a glucose monitor), you will need to remove this yourself for the duration of the imaging assessment (up to five hours) as our staff cannot do this for you. You will be welcome to use our facilities (e.g. a private room, sharps bin and dressings) to do this. Please seek professional advice prior to your appointment if you are unsure that you can safely remove your monitor for this time period.
- We may ask people with chest hair if a staff member can shave a small section of it. This is so that we can place electrical leads attached to sticky pads on the skin for an electrocardiogram (ECG - an electrical recording of the heart) and for the heart MRI scan.

MRI (magnetic resonance imaging) scans

- You will have two MRI scans, involving two separate scanners, each taking about 30 minutes. We will show you into a room containing one of the two MRI scanners. The MRI scanner is a large cylinder with a tube running through the middle which is open at both ends.

Image of an MRI scanner

- We will ask you to lie flat on your back (with your legs supported) on a comfortably padded table that gently glides you into the scanning tube. You will be given a pillow on the MRI heart scanner, but will need to be able to lie flat without a pillow on the MRI brain scanner.
- The MRI scanner is controlled by a computer which is in an adjacent room. A specially trained radiographer will operate the MRI scanner. They will be watching you through a window throughout the scan, and you will be able to talk to them through an intercom.
- MRI scanners are noisy and can vibrate (or judder) a bit. We will give you earplugs to protect your hearing, although most people will still hear quite a lot of noise. This is entirely normal and safe.
- You will have a hand-held buzzer so that you can alert the radiographer if you have an issue or would like to stop the process at any time.
- For the brain MRI scan, a helmet-like covering will be placed over your head. This allows a close detailed examination of your brain. A mirror in front of your face will allow you to view images shown on a screen behind you.
- For some MRI scans, you will be asked to perform certain tasks. For example, we will show you something on a screen (e.g. facial images or shapes) during the brain scan. We will ask you to hold your breath several times during the heart scan.

Neck ultrasound scan

- The neck ultrasound scan takes about 10 minutes.
- We will ask you to lie face-up on a firm table. We will apply a clear water-based gel to your neck and then place a hand-held probe against your skin and move it up and down your neck.

Image of a neck ultrasound

- We will ask you to tilt or turn your head as we move the probe over the entire length of both sides of your neck.
- The probe will move over the skin of your neck but will not touch your face or other parts of your body.

DXA (dual-energy X-ray absorptiometry) scan

- The DXA scan takes about 20 minutes.
- We will ask you to lie flat on your back (without a pillow) on a firm table while the arm of the scanner passes over you to take X-ray images of your bones.

Image of a DXA scanner

We will ask you to lie in various positions so that the scanner can take images of different parts of your body.

Autorefraction

- This measurement is performed on both eyes in a darkened room, and takes about two minutes.
- You will be asked to remove your glasses (if worn) and ideally to remove any contact lenses worn (although this is not essential).
- A handheld device will be used to take the measurements (see image); this has a forehead rest to help stabilise the device but there will be no contact with your eye.
- You will be asked to focus on an image while the measurements are taken.

Image of autorefraction process

Optical coherence tomography (OCT)

- This measurement is performed on both eyes in a darkened room, and takes less than five minutes.
- You will be asked to remove your glasses (if worn) but you can wear contact lenses. You will be asked to place your head against the device's forehead and chin rests to keep it stable while the images are taken. The device will be positioned in front of your eye (see photo) but there will be no contact with your eye.

Image of an optical coherence tomography machine

- You will be asked to focus on the centre of a cross. There will be a flash of light as the images are taken.

Other assessments

We would also like to take some more samples, ask questions and take measurements, similar to your previous visits to UK Biobank. This will allow scientists to take account of any changes in health and lifestyle since then and to obtain some new information about you.

We will ask you to do the following:

- Give another small sample of blood (about three tablespoons) and urine for long-term storage and analysis.
- Answer questions on a touchscreen computer about your health, lifestyle and diet, memory, work and family history.
- Have measurements of your blood pressure, pulse rate, arterial stiffness, height, weight, body fat, grip strength and lung function taken. You will also have an electrocardiogram (ECG) to measure the electrical activity of your heart.

If you are 65 years or older at the time of your visit, we may also ask if you would be prepared to wear a heart monitor for 14 days. This is a water-resistant monitor secured with an adhesive patch that is applied to your skin over the heart, which will provide information on heart rhythm. We will give this to you when you visit us, together with a box so that you can return the device to us after the 14-day period.

Do I need to have all the measurements taken?

You need to be willing to take part in all of the scans before you make an appointment.

You do not have to have all the physical measures, give a blood or urine sample or wear a heart monitor if you do not want to. Also, if you feel uncomfortable answering certain questions, you do not need to answer them.

What are the possible BENEFITS of taking part?

There are no direct benefits to you as an individual, although some people may regard having feedback about a potentially serious abnormality (if one is noticed during the scan) as a benefit. However, others may regard this as a risk if the abnormality turns out to be nothing serious (because of the short-term anxiety this information may cause). Please see the section below for more information about this.

More broadly, the information about you from the scans and other assessments will help scientists to better understand how a wide variety of diseases develop and to find new ways to prevent and treat them.

What are the possible RISKS of taking part?

Your repeat imaging assessment visit should not cause you any harm. We have chosen scans and other physical measures that are safe, painless, relatively quick and comfortable.

The MRI scans use powerful magnets and we take great care to prevent magnetic objects from entering the MRI room. Before you enter, we will ask you some questions to confirm your suitability for the scans. MRI scans involve lying flat in a slightly confined space and a small number of people may find this uncomfortable. However, the scanners we use in this assessment are wider (they are about 70 cm, or 27 inches, in diameter) than those typically used in hospitals to make sure that you will be as comfortable as possible.

The low-energy DXA scan involves a small dose of radiation - the same amount as a standard chest X-ray or about one week's worth of natural background X-rays (as a comparison, one transatlantic flight exposes you to about four times as much radiation as that from a DXA scan).

You may feel some discomfort when you have blood taken, although our health research assistants are specially trained to minimise this.

We take very seriously the health and safety of our participants and staff alike, and put in place strict measures to ensure that our imaging centres are safe. We routinely review our operational practices to minimise the risks to safety and to prevent the transmission of infections. To help with this, please do not attend your imaging clinic appointment if you have an infection which might affect or be transmitted to those around you, for example a respiratory infection (such as COVID-19, a cold or influenza), vomiting and diarrhoea or shingles.

Do I get any results from the visit?

It is important to understand that the visit is not a clinical appointment or a health check.

We will give you information at the end of the visit about a few of the measurements we take during the assessment (blood pressure, weight, body mass index, waist circumference, percent body fat and lung function, if measured). However, we will not provide any other results or images from the scans. This is in accordance with the consent that you provided when you agreed to take part in UK Biobank. Scans are being collected for research purposes only.

What if something suspicious is seen during my scans?

The scans we do are not intended to diagnose disease. They are not designed to find any particular abnormalities and will not be routinely analysed by doctors or other specialists. The radiographers who do the scans will be looking at the images to make sure of their quality, rather than looking for evidence of any health problems.

However, abnormalities can show up during the scanning process on scans taken for research purposes. Most of these are no cause for concern but if the radiographer does happen to notice a potentially serious abnormality while taking the scan, they will refer the scans after your visit to a specialist doctor (radiologist) for review.

If the radiologist agrees that the abnormality is potentially serious (regardless of whether or not it might be treatable), we will write to you and your GP, usually within a few weeks of your visit. Please note that we are not able to provide you or your GP with copies of scans.

We would consider something to be potentially serious if your scans suggested the possibility of a condition which, if confirmed, could have a major effect on how your body functions or on your quality of life, or could be life-threatening.

For example, we would tell you and your GP if we saw an abnormality on one of your scans that looked as though it could be a malignant tumour or another similarly serious condition, such as a large swelling of the aorta (the main artery of the body).

On the other hand, we would not tell you if we saw typical appearances of gallstones, a simple cyst or scarring (e.g., on the lung) as these abnormalities are common in healthy people and not considered serious.

We would also not tell you about something that is clearly related to a health condition that you have already told us about. Finally, we would not tell you about a potentially serious abnormality if it was identified at a later date by researchers analysing the scans.

From our experience so far, about two out of every hundred people taking part in this visit (2%) will have an abnormality that a radiologist agrees is potentially serious and which we will write to you and your GP about. About one in three of these people will turn out to have something serious that they may not have been aware of before, while two in three of these people will turn out to have something non-serious. This happens because something that looks suspicious on one of our research scans can turn out to be something like a benign cyst, an artefact (or technical glitch) of the scanning process, or something that you or your GP already know about (but we do not).

It is important to understand that we will not notice all potentially serious abnormalities. For this reason, if you do not receive any feedback from us about a potentially serious abnormality, you should not regard this as reassurance about your health. It should not stop you from seeing your doctor about any health concerns that you might have.

Please see our website (www.ukbiobank.ac.uk/incidental-findings) for further information about the types of potentially serious abnormalities that we will tell you and your GP about.

The radiographers undertaking the scanning are trained in how to report potentially serious abnormalities if detected.

What may happen if I am told about something suspicious on my scans?

Your GP may refer you to specialists for further investigation and treatment.

Some abnormalities found on scans might never have been noticed (especially if they never caused you any problems). Other abnormalities might have come to light weeks, months or even years later. Finding abnormalities on scans can lead to an earlier diagnosis, which can be helpful for some conditions. But sometimes it can lead to unnecessary anxiety, investigations and treatments. Some diagnoses could affect your ability to drive, work or get travel, health or life insurance.

You can only take part in the repeat imaging study if you agree that we can tell both you and your GP if we notice a potentially serious abnormality on one of your scans. If you feel that the anxiety of being told about an abnormality or the disruption to your life caused by further investigations is likely to outweigh any benefit to you, it might be better not to take part in the repeat imaging study.

Our approach to dealing with potentially serious abnormalities on the imaging scans was chosen because it strikes the best balance between:

- maximising benefit (due to the feedback provided to you and your GP about potentially serious abnormalities), and
- minimising harm (due to the unnecessary anxiety and clinical investigations caused by feedback of abnormalities that turn out to be non-serious).

Who will be able to use my information and samples?

We will store information and samples from your visit (for example, scans and blood results) for many years. The information will be used by approved researchers for medical and other health-related research. This includes scientists working in other countries and in commercial companies.

We will put the results from all of these studies back into our database for other researchers to use. Scientists must also make public the results of all research based on the resource so that everyone can benefit from it. You can find details of research that is being done using the UK Biobank resource and the related publications on our website (www.ukbiobank.ac.uk). We will never pass on your information, samples or test results to insurance companies or employers. Also, we will not allow the police, security services, relatives or lawyers to access your information, unless we are forced to do so by the courts.

How will you keep information about me confidential?

We have strict measures in place to protect your confidentiality, which should prevent identifiable information from being used – inadvertently or deliberately – for any purpose other than to support this study:

- We do not include any details that will identify you in any information or samples we provide to researchers. Furthermore, all the brain scans are 'defaced' so that researchers using these scans will not be able to tell your identity from these data.
- We keep any information that might identify you (such as your name and address) separately from other information about you in our database.
- We use advanced computer security technologies to prevent unauthorised access to the computers that hold your personal information.

- We operate quality and information security management systems that support the collection, processing, storage and analysis of biological samples and data for research into genetic and environmental factors that impact on human health and disease.
- The systems are audited and certified by the British Standards Institute (BSI) to ISO 9001 and ISO/IEC 27001 respectively. You can view the status of our certifications for the various sites by searching for 'UK Biobank' at this link <https://www.bsigroup.com/en-GB/validate-bsi-issued-certificates/>
- We also follow the guidance contained in the UK Government's ten cyber security steps.
- We restrict access to personal information as much as possible, and all research staff working for us sign confidentiality agreements as part of their employment contracts.

Privacy statement

The way in which UK Biobank collects, shares and uses your information is explained on our website at:

[**https://www.ukbiobank.ac.uk/explore-your-participation/basis-of-your-participation**](https://www.ukbiobank.ac.uk/explore-your-participation/basis-of-your-participation)

This includes an explanation of the way in which we protect your data and remove any personal identifiers before making data available to researchers.

Who has reviewed the study?

All of the research conducted by UK Biobank is looked at by an independent group of people, called a Research Ethics Committee, to protect participants' interests. This study has been reviewed and given favourable opinion by the North West – Haydock Research Ethics Committee.

Who do I contact if I have any questions?

If this leaflet does not answer your questions, please:

- visit our website at **www.ukbiobank.ac.uk/explore-your-participation/contribute-further/imaging-study**
- phone us free of charge on **0800 0 276 276** (Monday to Friday 9am to 5pm) for more information; or
- email us at **ukbiobank@ukbiobank.ac.uk**.

If you would like to contact the Principal Investigator, please send a letter to Professor Sir Rory Collins, UK Biobank, 1-2 Spectrum Way, Adswold, Stockport, Cheshire, SK3 0SA, or email **ukbiobank@ukbiobank.ac.uk**

We shall reply to your letter or email promptly in writing, unless you ask us to phone you (in which case, please include your phone number in your letter or email).

UK Biobank Limited (company no. 4978912) is a registered charity in England & Wales (1101332) and in Scotland (SC039230)
