

# FROM ETHICS AND GOVERNANCE COUNCIL TO ETHICS ADVISORY COMMITTEE UK BIOBANK

ANTICIPATING AND RESPONDING TO ETHICAL ISSUES

Anneke Lucassen 19-6-19

# FROM EGC TO EAC

EGC established by WT and MRC, when UK Biobank began the recruitment of its participants in 2006.

Acted as an independent guardian of the UK Biobank Ethics and Governance Framework (EGF); monitored and reported publicly on the conformity of the UK Biobank project with that framework

Advised on the interests of research participants and the general public in relation to UK Biobank.

**In 2018 EGC recommended that its oversight role would be more effectively discharged by better integration within UK Biobank as an advisory committee of the UK Biobank Board.**

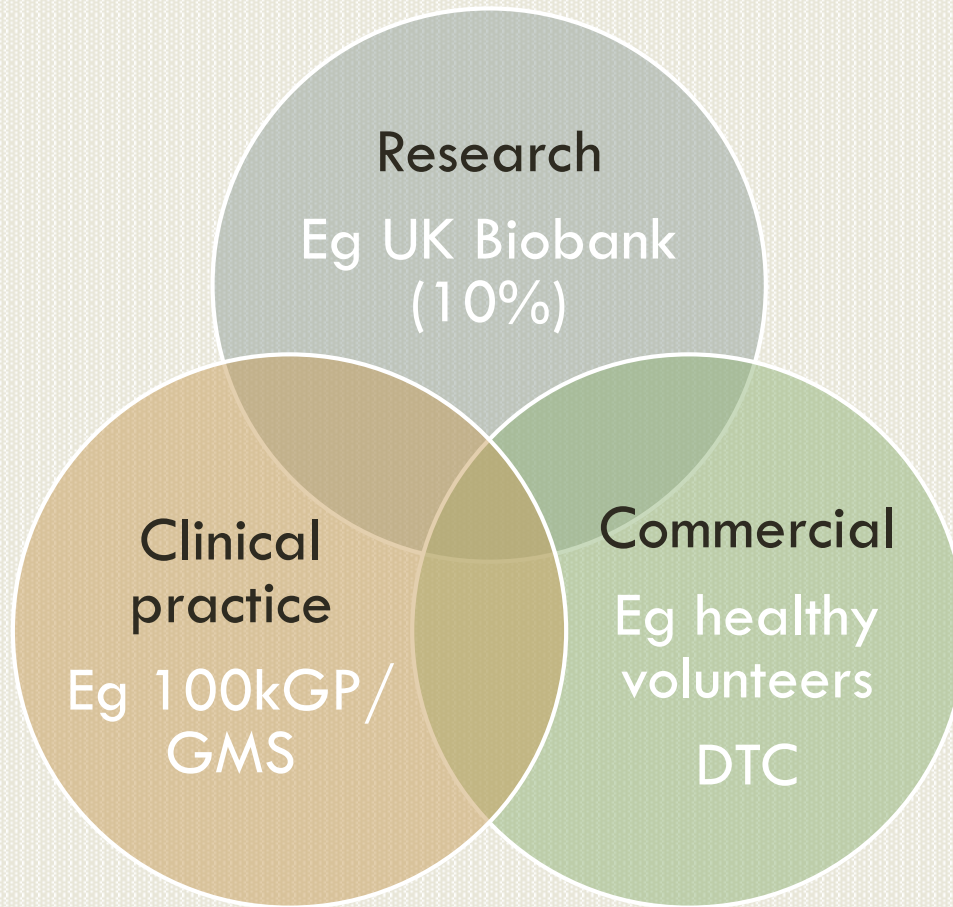

# EAC REMIT

To provide advice to the UK Biobank Board on ethical issues that arise during the maintenance, development and use of the UK Biobank resource, including:

1. identifying, defining and examining relevant ethical issues, delivering key research in these areas;
2. providing advice, guidance and recommendations on relevant ethical issues;
3. reviewing and advising on policies which have an ethical dimension that is relevant to UK Biobank.

**Expertise:** clinical, bioethics, law, philosophy, epidemiology, molecular science, broadcasting,

# VISION OF 5 MILLION GENOMES

Activities will overlap

Ongoing debate on types of consent for each

Ongoing debate on types of feedback for each

Diagnosis and prediction often conflated

Genomics continues to attract a very deterministic discourse

UKB data already provides cautionary tales

# UKB FINDINGS HELPFUL AT INTERFACE

## COMPOSITE EXAMPLE:

- Jane, aged 50, given direct to consumer ancestry test as present
- She sent her raw data for secondary analysis for medical results
- BRCA1 mutation found. She has no known family history of breast or ovarian cancer
- Would like risk reducing mastectomy and oophorectomy
- NHS Sanger sequencing shows NO BRCA1 mutation.
- SNP arrays very bad at 'calling' rare high risk variants.
- 85-95% of **rare variants** called by this DTC test are wrong

# FEEDBACK OF RESULTS FROM WGS

1. Analytical validity- SNPs bad at calling rare variants
2. Clinical validity- penetrance of pathogenic mutations in healthy populations

variants in a Population Setting, *The American Journal of Human Genetics* (2019), <https://doi.org/10.1016/j.ajhg.2018.12.015>

## Assessing the Pathogenicity, Penetrance, and Expressivity of Putative Disease-Causing Variants in a Population Setting

Caroline F. Wright,<sup>1,\*</sup> Ben West,<sup>1</sup> Marcus Tuke,<sup>1</sup> Samuel E. Jones,<sup>1</sup> Kashyap Patel,<sup>1</sup> Thomas W. Laver,<sup>1</sup> Robin N. Beaumont,<sup>1</sup> Jessica Tyrrell,<sup>1</sup> Andrew R. Wood,<sup>1</sup> Timothy M. Frayling,<sup>1</sup> Andrew T. Hattersley,<sup>1</sup> and Michael N. Weedon<sup>1,\*</sup>

More than 100,000 genetic variants are classified as disease causing in public databases. However, the true penetrance of many of these rare alleles is uncertain and might be over-estimated by clinical ascertainment. Here, we use data from 379,768 UK Biobank (UKB) participants of European ancestry to assess the pathogenicity and penetrance of putatively clinically important rare variants. Although rare variants are harder to genotype accurately than common variants, we were able to classify as high quality 1,244 of 4,585 (27%) putatively clinically relevant rare (MAF < 1%) variants genotyped on the UKB microarray. We defined as “clinically relevant” variants that were

## RELEVANT TO OTHER COHORTS AND OTHER ACTIVITIES

Press release: "the people that most often mentioned religious language like "God" or "pray" in their [Facebook] posts were 15 times more likely to have diabetes than those who used these terms the least."

[pennmedicine.org/news/news-rele...](https://pennmedicine.org/news/news-rele...)

The image is a screenshot of a Penn Medicine News Release webpage. At the top, there is a dark blue header with the Penn Medicine logo on the left and a search bar on the right. Below the header, there are four navigation links: "News Releases" (in red), "News Blog", "Publications & Special Projects", and "Internal Newsletters". A light gray banner below the navigation contains the text "News Release". The main content area features a large title: "Facebook Posts Better at Predicting Diabetes, Mental Health Than Demographic Info". Below the title is a subtitle in italics: "Analyzing language shows that identifying certain groups of words significantly improves upon predicting some medical conditions in patients". The date "June 17, 2019" is displayed below the subtitle. The main text begins with "PHILADELPHIA – Language in Facebook posts may help identify conditions such as diabetes, anxiety, depression and psychosis in patients, according to a study from Penn Medicine and Stony Brook University researchers. It's". To the right of the text, there is a photograph of a woman with long dark hair, looking down with her hand to her forehead, suggesting distress or worry.
